This oven is permanently set at 80C for drying substrates at the end of the plate cleaning process.

This oven is not to be used for any other purpose, nor is it to be used as a storage cabinet.

0. Open the oven to make sure nothing is inside. If there is, remove/discard. Remove the tray and wipe down with IPA to clean, then place back into the oven.

1. If the oven is empty, turn on power at the front, left.

2. The oven will show 80 (C) in the lower of the two numbers. This is the set point. If the oven does not show 80, change the value to 80 by pressing the up and down arrows as required.

3. The top number is the current temperature of the oven. When the oven is turned on, it will automatically begin heating to reach the set point that is displayed. For 80 C, this will take about 20 minutes.
4. When a carrier of IPA rinsed plates is placed inside the oven, the carrier must be set on the tray. Please do not remove this tray from the oven other than to clean it.

5. Place substrates inside the oven, on the tray, and then if a timed dry cycle is desired start the timer and close the door.

6. When the desired time is elapsed, remove substrates from the oven, stop and reset the timer. Please do not remove the drying oven timer from this work station.

7. When you are done drying plates, turn the oven off.
